

SE Lab 2 — Agile Project Management with Jira

Problem Statement #17 | Vaccination Cohort & Dose Scheduling System

PES University — Department of Computer Science & Engineering

Jira Project Link: <https://cs385.atlassian.net/jira/software/projects/SCRUM/boards/1>

1. Epics & User Stories / Backlog

Four epics were created: Citizen Registration & Cohort Management, Slot Booking & Dose Scheduling, Dose Administration & Records, and Certificate Generation & Verification. Six user stories were created across these epics and added to the backlog.

Figure 1: Backlog showing 6 user stories with epic labels and story point estimates (total: 29 points)

Figure 2: Active sprint backlog showing all stories with epic colour-coding and statuses

2. Story Points

Story point estimates were assigned to each user story based on relative complexity using the Fibonacci scale.

Story ID	User Story	Epic	Points
SCRUM-5	Register my profile to be enrolled in the correct cohort	Citizen Registration	3

Story ID	User Story	Epic	Points
SCRUM-6	Browse available vaccination slots by date and location	Slot Booking	5
SCRUM-7	Block Dose 2 booking until minimum interval has passed	Slot Booking	5
SCRUM-8	Record dose administration details to update citizen history	Dose Administration	5
SCRUM-9	View my vaccination history to track dose status	Dose Administration	3
SCRUM-10	QR certificate generated automatically after final dose	Certificate Generation	8
	Total		29

Figure 3: Sprint 1 backlog with story point estimates visible for all 6 stories

3. Active Sprint Board

SCRUM Sprint 1 runs from 26 Aug to 9 Sep. Stories are distributed across To Do, In Progress, In Review, and Done columns.

Figure 4: Active Sprint Board showing stories across In Progress (2), In Review (2), and Done (2) columns

4. Burndown Chart

The sprint burndown chart tracks remaining work against the guideline from sprint start (Aug 26) to sprint end (Sep 9).

Figure 5: Sprint Burndown Chart — Aug 26 to Sep 9, showing Remaining Work vs Guideline

5. Reflection

Q: What is a sprint and why did you choose a 2-week duration?

A: A sprint is a fixed-length time-box in Scrum within which a defined set of backlog items are planned, executed, and reviewed. A 2-week duration was chosen because it provides sufficient time to complete meaningful user stories while keeping feedback cycles short and progress measurable, which is especially appropriate for a mid-sized system like the Vaccination Cohort & Dose Scheduling System.

Q: What challenges did you face during sprint planning?

A: The primary challenge was estimating story points accurately without prior implementation experience. Assigning relative effort scores required careful comparison of stories against each other. Additionally, determining which stories to prioritise for Sprint 1 required analysing dependencies — for example, citizen registration needed to precede slot booking and dose administration.

Q: What would you do differently in Sprint 2?

A: In Sprint 2, I would decompose larger stories — particularly the QR certificate generation story (8 points) — into smaller, more manageable sub-tasks to reduce delivery risk and improve estimation accuracy. I would also define acceptance criteria more explicitly within each story to make the Definition of Done clearer for each item.
